INTRODUCTION

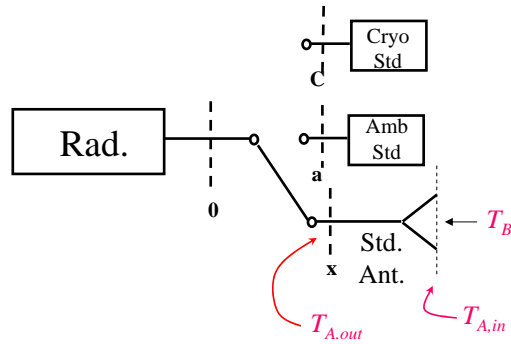

- NIST microwave radiometry effort
 - Noise & antenna metrology have been conducted separately for over 30 years
 - Recently began doing remote-sensing radiometry, combining the two
- NIST Optical Tech. Div. has such a program for UV, Visible, & IR
- Developing analogous capabilities at microwave & mm-wave frequencies, providing a link between microwave remote-sensing measurements & NIST measurements & standards

- Calibration
 - linear radiometers \Rightarrow need (\geq) two standards for calibration
 - need independent cal of targets, comparison to other radiometers, traceability
- Develop (& transfer) a standard for microwave brightness temperature
- Still in early stages, but some progress made

THEORETICAL FRAMEWORK

- Standard radiometer
- Brightness temperature
- Chamber
- Expected uncertainty

- Radiometer measures $T_{A,out}$; want to determine T_B (assume far field conditions)

$$T_{A,out} = \alpha T_{A,in} + (1 - \alpha) T_a$$

$$T_B(\theta, \phi) \equiv \frac{\lambda^2 B_f(\theta, \phi)}{2k}$$

$$T_{A,in} = \frac{\int T_B(\theta, \phi) F_n(\theta, \phi) d\Omega}{\Omega_p}$$

$$\Omega_p = \int_{4\pi} F_n(\theta, \phi) d\Omega$$

- Break up $T_{A,in}$:

$$\overline{T}_T = \frac{\int_{\text{target}} T_B(\theta, \phi) F_n(\theta, \phi) d\Omega}{\int_{\text{target}} F_n(\theta, \phi) d\Omega}$$

$$\overline{T}_{BG} = \frac{\int_{\text{other}} T_B(\theta, \phi) F_n(\theta, \phi) d\Omega}{\int_{\text{other}} F_n(\theta, \phi) d\Omega}$$

$$\eta_{AT} \equiv \frac{\int_{\text{target}} F_n(\theta, \phi) d\Omega}{\Omega_p}$$

$$T_{A,in} = \eta_{AT} \overline{T}_T + (1 - \eta_{AT}) \overline{T}_{BG}$$

- So,

$$T_{A,out} = \alpha \eta_{AT} \bar{T}_T + \alpha(1 - \eta_{AT}) \bar{T}_{BG} + (1 - \alpha) T_a$$

- Control the background, $\bar{T}_{BG} = T_a$
- Then

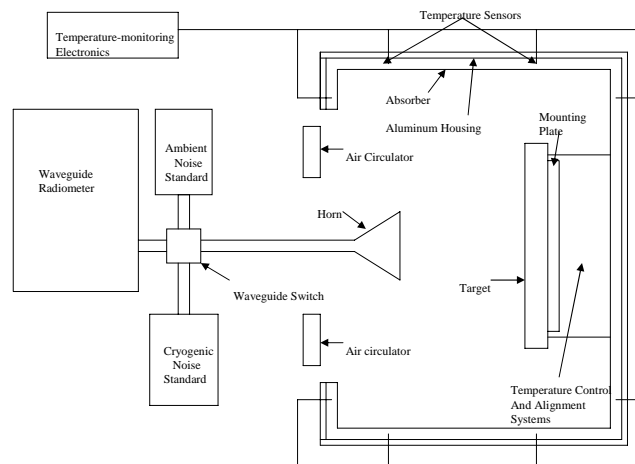

$$\bar{T}_T = T_a + \frac{1}{\alpha \eta_{AT}} (T_{A,out} - T_a)$$

- So we need $\alpha \approx 1/L$ and η_{AT}

$$\eta_{AT} \equiv \frac{\int_{\text{target}} F_n(\theta, \phi) d\Omega}{\Omega_p}$$

Chamber

- Will need a chamber to control background

- Approximate achievable uncertainties:

$$u^2(\bar{T}_T) = \left(1 - \frac{1}{\alpha \eta_{AT}}\right)^2 u^2(T_a) + \left(\frac{1}{\alpha \eta_{AT}}\right)^2 u^2(T_{A,out}) + (\bar{T}_T - T_a)^2 \left(\frac{u^2(\eta_{AT})}{\eta_{AT}^2} + \frac{u^2(\alpha)}{\alpha^2} \right)$$

$$u(T_a) \approx 0.2 \text{ K}$$

$$u(T_{A,out}) \approx 0.3 - 0.5 \text{ K (for } T_{A,out} = 200 \text{ to } 300 \text{ K, } 18 - 26.5 \text{ GHz)}$$

$$u(\eta_{AT}) \approx 0.003$$

$$u(\alpha) \approx 0.005$$

- So should be able to get

$$u(\bar{T}_T) \approx 0.3 \text{ K to } 0.7 \text{ K}$$

$$\text{for } T_{A,out} = 200 \text{ to } 300 \text{ K, } 18 - 26.5 \text{ GHz}$$

MEASUREMENTS (PRELIMINARY)

- Measured antenna pattern for a standard-gain horn (SGH) on the near-field range

Far-field at K-Band Standard Gain Horn at 26 GHz

- Integrate pattern to get η_{AT} ; value depends on frequency & distance. At 26 GHz, $\eta_{AT} = 0.980$ at 50 cm, $\eta_{AT} = 0.301$ at 5 m
- Compute α from conductivity.
 $\alpha = 0.9954 \pm 0.0023$ at 26 GHz
- Connected SGH to the DUT plane of the WR-42 (18 – 26.5 GHz) waveguide radiometer

- Borrowed hot calibration targets from NOAA GSR (Al Gasiewski & Marian Klein, NOAA ETL) and NASA Goddard (Paul Racette)
- Measured it in the NIST anechoic chamber at 18, 22, & 26 GHz for several distances

- 5 m results discrepancy probably just due to (mis)alignment

- Uncertainty large due to large $u(\eta_{AT}) = 0.0153$. Would be $u(\eta_{AT}) \approx 0.003$ if we knew target location better

- Type A uncertainties (target drift)
- Target location & angles
- Alignment of radiometer & target
- Near/Far field
- Emissivity: $T_T = eT_{target} + (1 - e)T_{refl}$, $e = ?$

SUMMARY

- Developing a microwave (18 – 65 GHz) brightness-temperature standard based on existing noise standards and radiometers, plus antenna characterization
- Have developed framework and performed preliminary measurements
- Expect uncertainties of about 0.5 – 0.7 K for $T_B = 200$ to 300 K, $f = 18 - 26$ GHz (Larger uncerts for higher/lower temperatures and/or higher frequencies)

- Next:
 - Further preliminary measurements (different target)
 - Design & build special-purpose chamber
 - Measurements in special-purpose chamber
 - Measurements of a target in the IR using TXR radiometer
 - Develop standard target
